

MiniProject – 1 (Topic -2)

In this project I had to make a object detection algorithm using YOLO. Object detection includes both image recognition and localization. Initially I tried to make dataset myself and tried to train the model but the model was underfitting due to lack of data and less epochs. Then I finally trained my model on a data of 160 images and validated it on 20 images. My model detects three classes of objects:

- Chairs
- Tables
- Trash bins

I used YOLO26 for this and finally got a mAP of about 81%.
